Case Study 8: Online Food Ordering Website

Overview

The Online Food Ordering Website is designed to let customers browse food items and place orders through a simple web interface. The page includes a navigation bar, a promotional offer, food categories, menu cards with images and prices, a shopping cart, and customer reviews. These elements make it easier for users to discover dishes and understand the cost before ordering.

Main features: food categories; menu cards for pizza, burgers, ice cream and cake; prices; Add to Cart and Buy Now buttons; cart total; offer banner; customer reviews; responsive layout for smaller screens.

Purpose and learning outcome: This project demonstrates how HTML structures a menu, how CSS styles cards and page sections, and how a food-ordering interface can be organized for usability. In a full application, JavaScript and a backend would be needed to process real orders, payments, and customer data. The displayed menu and reviews are sample project content.

Case Study 11: Hospital and Healthcare Services Website

Overview

The Hospital and Healthcare Services Website presents important hospital information in one place. Visitors can explore medical departments, view doctor profiles, learn about facilities and visiting hours, find emergency contact information, and submit an appointment request.

Main features: departments such as cardiology, neurology, orthopedics, pediatrics, general medicine and ophthalmology; doctor cards; facilities; visiting hours; emergency contact section; and an appointment form with name, email, phone, department, preferred date and an optional message.

Purpose and learning outcome: This project demonstrates clear information hierarchy, accessible form labels, navigation links, and a responsive card layout. The emergency number, doctor names, and schedules shown are sample data and should be replaced with verified details before any real-world use. A server or backend is required to save appointment requests.

Case Study 30: Bus and Train Ticket Booking Interface

Overview

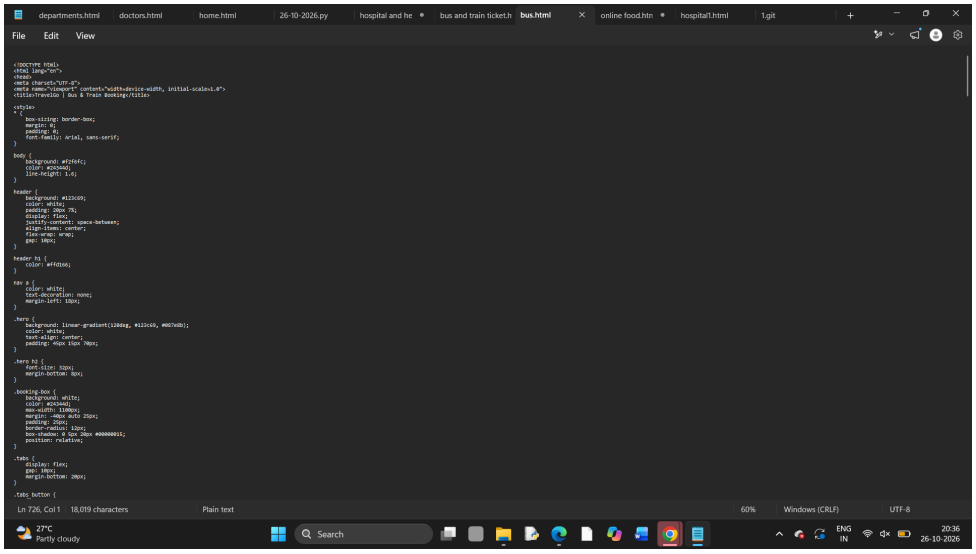

The Bus and Train Ticket Booking Interface helps users explore transport services and prepare a booking. Its layout provides a choice between bus and train, route and travel-date fields, passenger selection, available service cards, a seat-selection area, fare information, and a passenger-details form.

Main features: bus/train tabs; source and destination inputs; travel date and passenger count; service departure and arrival times; fare per person; seat availability indicators; selected-seat and total-fare summary; fare table; and passenger details form.

Purpose and learning outcome: This project demonstrates form design, tables, service cards, selection states, and a booking-oriented page layout. The routes, schedules, seat status, and fares are sample project data. Real ticket booking would require live transport data, server-side validation, secure payment handling, and a booking database.
